Rainwater harvesting is the need of the day. It is a simple process to conserve rainwater which falls in abundance at every downpour, by collecting, strong, conveying and purifying rainwater that run down from the rooftops and open spaces, redirected to a tank deep pit with percolation, so that it seeps down and recharge the water table. Without this process, water will become scarce and will result in cutting off our life support.

Our college campus is fitted with rain water harvesting system channelizing rain water to the bore well in the premises. This has resulted in double benefit of not only conservation rain water but has also kept the bore well recharged and replenished for sustained use over a period of time.

The college demonstrates utmost responsibility in utilizing every drop of this elixir of life though waste water recycling mechanism. The impure water generated by drinking water filters is collected and used for gardening and washing purposes.

Paver Blocks laid in the campus aids in the percolation of rain water, thereby rejuvenating the ground water level, ultimately becoming part of lakes and rivers.
